- The intensity of light from a stage light decreases exponentially with the thickness of the coloured gels covering it. The intensity, I , in watts per square centimetre, can be calculated using the formula $I = 1200\left(\frac{4}{5}\right)^n$, where n is the number of coloured gels used. What is the intensity of light with the following number of gels?
a) 0 gels b) 2 gels c) 4 gels

- A city with a population of 67 000 is losing 5% of its population each year. This situation can be represented by the equation $P = 67\,000(0.95)^n$, where P is the city's population and n is the number of years.
a) What will be the city's population in 5 years, 3 months?
b) If the rate of loss was the same in previous years, what was the population 3.5 years ago?
