

4 Irish Industrial Revolution Inventions

BY COLTON SIMMS

Colored Photography

John Joly was one of Irelands most impressive inventors during the industrial revolution, one of his most impressive feats was creating colored photography. **Colores photography was invented in 1894**

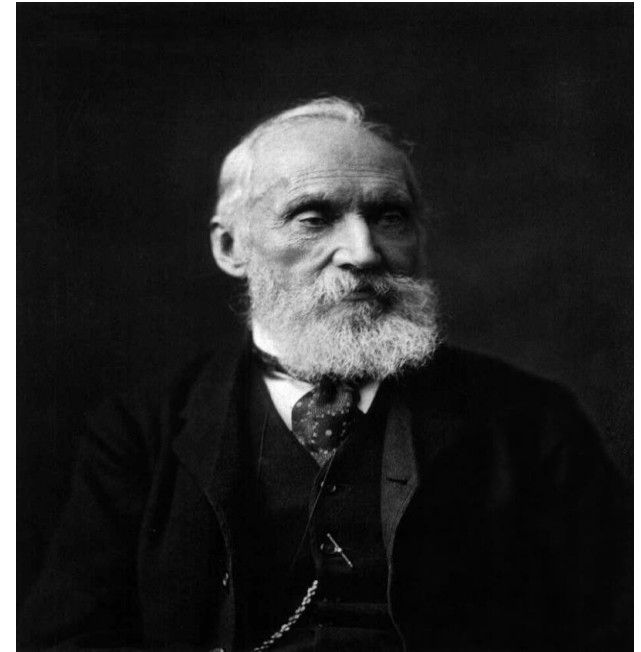

Binaural Stethoscope

The Stethoscope is arguably the most important medical tool ever used. The Binaural Stethoscope made by Arthur leared in 1851 was the first one ever made. A stethoscope is used to Listen to steady sounds in a human or animal bodies. It is most commonly used for the heart, lungs, blood flows and blood vessels.

Hypodermic Syringe

Hypodermic Syringe
made by Francis Rynd in
1844

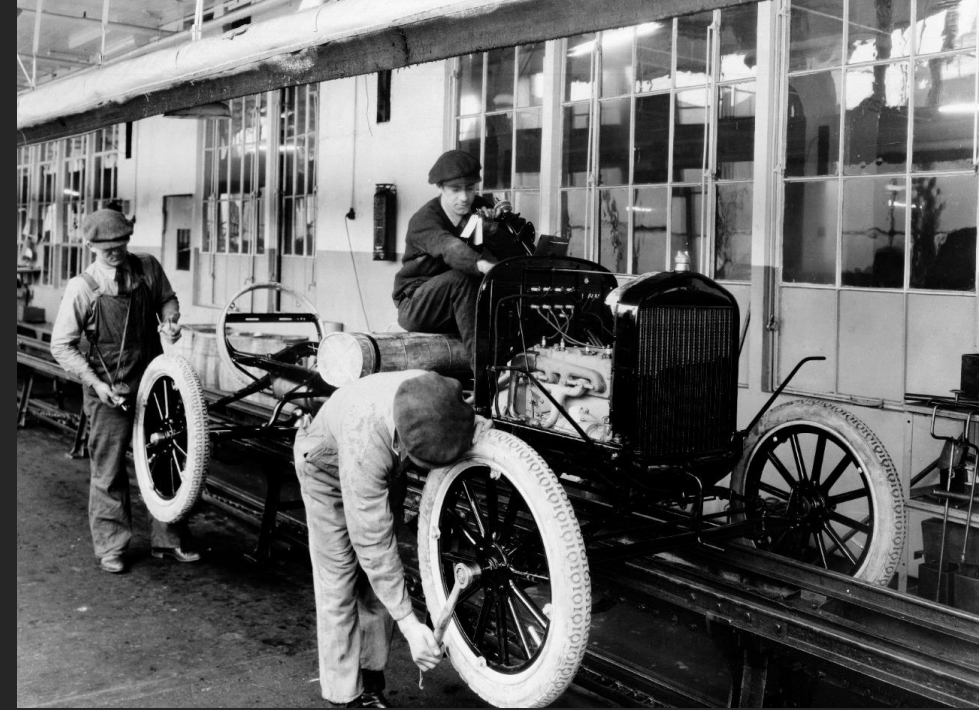

Francis Rynd

The Syringe is another medical tool that is vital for doctors. If there was no such thing as a syringe doctors could eject medicine into people's body's, they also couldn't transfer blood. A syringe is a tool that can suck liquid into a capsule and can release it back out. The syringe is used to suck out bad liquids out of a body or out medicines into a body. It can also be used to transfer blood.

Assembly Line

The genius that invented the assembly line in 1901 is Ransom E. Old's. The assembly line is still used today in almost all factories. The assembly line is a process in which something goes through different stages where people do different things to it until it's complete. When Henry Ford made his own assembly line in 1913 he saw some flaws in the original design, the biggest one was the fact that the pulley system on the original design was very inconvenient. So Henry Ford decided to make it a conveyor system. I believe that the assembly line will be used for years to come, and will only be upgraded as time moves past.
